

Course -1

Name: Saviynt Introduction

Module 1: Introduction to Saviynt

What is Saviynt?

Saviynt is a cloud-based **Identity Governance and Administration (IGA)** platform that helps organizations manage **users, identities, accounts, roles, and access permissions** securely.

It automates the complete identity lifecycle, manages access requests, performs compliance checks, and improves overall security.

Simple Definition

Saviynt is an Identity Governance platform that ensures **the right user gets the right access to the right resource at the right time.**

Why Do Organizations Need Saviynt?

Large organizations have:

- Thousands of employees
- Contractors
- Vendors
- Applications
- Cloud services
- Databases

Managing access manually becomes difficult.

Saviynt helps by:

- Automating access management
 - Improving security
 - Reducing manual work
 - Maintaining compliance
 - Preventing unauthorized access
-

Problems Before Saviynt

Without Saviynt:

- Users receive incorrect access.
 - Former employees may still have access.
 - IT teams manually manage permissions.
 - Difficult to identify security risks.
 - Compliance audits take a long time.
 - Different security tools work separately.
-

How Saviynt Solves These Problems

Saviynt provides one platform that combines multiple security capabilities:

- Identity Governance (IGA)
- Privileged Access Management (PAM)
- Application Access Governance (AAG)
- External Identity Management (EIM)
- Identity Security Posture Management (ISPM)

This is called a **Converged Identity Platform**.

What is Identity Governance (IGA)?

IGA manages the complete identity lifecycle.

It ensures users receive the correct access based on their role.

Main Functions

- User onboarding
- User modification
- User offboarding
- Access requests
- Access approvals
- Access reviews
- Compliance reporting

Example

A new employee joins as an HR Executive.

Saviynt automatically:

- Creates the user account.
 - Grants HR application access.
 - Assigns HR role.
 - Removes access automatically when the employee leaves.
-

What is PAM (Privileged Access Management)?

PAM manages highly privileged accounts.

These accounts include:

- System administrators
- Database administrators
- Root users
- Cloud administrators

Why?

Privileged accounts have maximum permissions.

If compromised, they can cause serious damage.

Example

A Database Administrator needs admin rights for 2 hours.

Saviynt grants temporary privileged access.

After 2 hours, access is removed automatically.

What is AAG (Application Access Governance)?

AAG manages application-level access and prevents users from getting conflicting permissions.

It mainly handles **Segregation of Duties (SoD)**.

Example

One employee should not have both:

- Create Vendor
- Approve Vendor Payment

Having both permissions can lead to fraud.

Saviynt detects and prevents this conflict.

What is EIM (External Identity Management)?

EIM manages identities outside the organization.

Examples:

- Vendors
- Contractors
- Consultants
- Business partners

Example

A vendor works for three months.

Saviynt automatically:

- Creates the vendor account.
 - Gives temporary access.
 - Removes access after the contract ends.
-

What is ISPM (Identity Security Posture Management)?

ISPM continuously monitors identity-related risks.

It detects:

- Excessive permissions
- Misconfigurations
- Policy violations
- Unused privileged accounts
- Identity risks

Example

A user accidentally receives administrator rights.

ISPM identifies this risk and alerts administrators.

What is a Converged Platform?

Instead of using different tools for:

- IGA
- PAM
- AAG
- EIM
- ISPM

Saviynt combines everything into **one platform**.

Benefits

- Easier management
 - Better security
 - Lower cost
 - Single dashboard
 - Faster implementation
-

Main Features of Saviynt Identity Cloud

Identity Lifecycle Management

Automates Joiner, Mover, and Leaver (JML) processes.

Access Request Management

Users can request access through a self-service portal.

Approval Workflow

Managers or application owners approve or reject access requests.

Access Certification

Managers periodically review users' access to ensure it is still required.

Role Management

Users receive access based on business roles.

Segregation of Duties (SoD)

Detects conflicting permissions that may lead to fraud.

Compliance Reporting

Generates reports for audits and regulatory compliance.

AI Recommendations

Uses machine learning to recommend appropriate access and identify risky permissions.

Single User Interface

All identity management functions are available in one dashboard.

Copilot / ChatOps

Users can request access using natural language through collaboration tools.

Example:

"Request SAP Finance Access."

Identity Lifecycle (JML)

Joiner

New employee joins.

Saviynt:

- Creates account.
- Assigns roles.
- Grants required access.

Mover

Employee changes department.

Saviynt:

- Removes old permissions.
- Grants new permissions.

Leaver

Employee leaves.

Saviynt:

- Disables account.
- Removes all access.
- Prevents unauthorized usage.

Benefits of Saviynt

- Centralized identity management
- Improved security
- Automated provisioning
- Faster onboarding
- Reduced manual effort
- Compliance support
- Audit readiness
- Role-based access
- Risk reduction
- Better user experience

Real-Time Example

Suppose **Rahul** joins the Finance department.

Saviynt automatically:

1. Creates Rahul's account.
2. Assigns Finance role.
3. Grants SAP Finance access.
4. Sends approval if additional access is required.
5. Reviews Rahul's access during certification.
6. Removes access when Rahul leaves.

Everything is automated.

Quick Interview Definitions

Saviynt

A cloud-based Identity Governance platform used to manage identities, accounts, roles, and user access securely.

IGA

Manages the complete identity lifecycle and user access.

PAM

Secures privileged or administrator accounts.

AAG

Manages application access and prevents Segregation of Duties (SoD) violations.

EIM

Manages external users such as vendors and contractors.

ISPM

Continuously monitors identity security risks and policy violations.

Identity Lifecycle

The process of managing users from joining the organization until they leave.

Joiner-Mover-Leaver (JML)

The automated process of creating, updating, and removing user access.

Interview Questions

Q1. What is Saviynt?

Saviynt is a cloud-based Identity Governance platform that automates identity lifecycle management, access requests, approvals, compliance, and security.

Q2. Why do organizations use Saviynt?

To automate access management, improve security, reduce manual work, ensure compliance, and manage identities from a single platform.

Q3. What are the main modules of Saviynt?

- IGA
- PAM
- AAG
- EIM

- ISPM
-

Q4. What is a Converged Platform?

A single platform that combines multiple identity security capabilities such as IGA, PAM, AAG, EIM, and ISPM.

Q5. What is the identity lifecycle?

It is the process of managing a user's access from the time they join an organization until they leave.

These notes cover all the important concepts from the module in a simple, interview-friendly format. As you send each remaining Saviynt course or module, I'll prepare notes in the same style so that, by the end, you'll have a complete office evaluation handbook.
