

Course – Certifications

Module 1 – Introduction to Certifications

(One of the Most Important Governance Features in Saviynt)

Introduction

Managing user access is not a one-time activity.

Employees:

- Join the organization
- Change departments
- Get promoted
- Leave the company

If their access is never reviewed, users may keep unnecessary permissions, creating security and compliance risks.

To solve this problem, organizations perform **Access Reviews (Certifications)**.

Saviynt provides a powerful Certification module that helps organizations periodically review user access and ensure that only the right people have the right access.

What is Certification?

Definition

Certification (also called **Access Review**) is the process of periodically reviewing users, accounts, roles, entitlements, and applications to verify that access is still required.

Simple Definition

Certification means:

Reviewing user access regularly and deciding whether the access should be kept or removed.

Why is Certification Required?

Organizations constantly change.

Examples:

- Employees join.
- Employees transfer to another department.
- Employees leave.
- Contractors become permanent employees.

If access is never reviewed:

- Former employees may still have accounts.
- Users may have excessive privileges.
- Security risks increase.
- Compliance requirements are violated.

Certification helps identify and remove unnecessary access.

Real-Life Example

Rahul worked in the Finance department.

He had access to:

- SAP Finance
- Oracle Finance
- Finance Shared Drive

After six months, Rahul moved to HR.

If nobody reviews his access, he still has Finance permissions.

During a Certification campaign:

The manager reviews Rahul's access and removes the Finance permissions.

This reduces security risk.

Why is Certification Important?

Certification is important for several reasons.

1. Risk Management

Organizations reduce security risks by removing unnecessary access.

Example:

An employee still has administrator privileges after changing departments.

Certification identifies and removes that access.

2. Compliance

Many regulations require organizations to review user access regularly.

Examples:

- SOX
- HIPAA
- PCI-DSS
- ISO 27001

Certification helps organizations meet these compliance requirements.

3. Verify Ownership

Certification verifies:

- Does this manager still manage the employee?
 - Does this entitlement still belong to this owner?
 - Is the application owner correct?
-

4. Remove Excess Access

Over time, users accumulate unnecessary permissions.

Certification identifies these permissions and removes them.

This follows the **Principle of Least Privilege**.

5. Organization Changes

Certification helps during:

- Joiners
 - Movers
 - Leavers
 - Promotions
 - Department changes
-

Benefits of Certification

- Improves security.
- Reduces risk.
- Removes unnecessary access.
- Helps during audits.
- Ensures compliance.
- Confirms ownership.
- Supports Segregation of Duties (SoD).
- Provides a complete audit trail.

What Can Be Certified?

Saviynt can review many identity objects.

Examples:

- Users
- Accounts
- Roles
- Entitlements
- Applications
- Service Accounts
- Organizations

Certification Types in Saviynt

Saviynt supports multiple Certification campaign types.

1. User Manager Certification

The employee's manager reviews the employee's access.

Manager checks:

- Does this employee still report to me?
- Does this employee need these accounts?
- Should these roles remain?

Example:

Rahul's manager reviews Rahul's SAP and Office 365 access.

2. Entitlement Owner Certification

The owner of an entitlement reviews:

- Entitlements
- Child Entitlements
- Accounts associated with those entitlements

Example:

The AD Group owner reviews whether users still need membership in the "Finance Users" group.

3. Role Owner Certification

The role owner reviews:

- Enterprise Roles
- Child Entitlements
- Users assigned to the role

Example:

The owner of the "Finance Enterprise Role" verifies that all assigned users still require it.

4. Application Owner Certification

The application owner reviews:

- User accounts
- Application roles
- Entitlements
- Endpoint access

Example:

The Salesforce administrator reviews all Salesforce accounts.

5. Service Account Certification

Service account owners review:

- Service accounts
- Access granted to service accounts

Example:

A database service account is reviewed to ensure it is still required.

6. Organization Owner Certification

Organization owners review:

- Vendors
 - Organizational memberships
 - Organization access
-

7. Self-Certification

Users review their own access.

Example:

Rahul reviews his own SAP and Outlook access.

The manager may still perform a final review depending on the organization's policy.

Campaign in Saviynt

What is a Campaign?

A Campaign is a collection of multiple certifications grouped together.

Simple Definition

Instead of reviewing users one by one,
Saviynt groups many certifications into one campaign.

Why Use Campaigns?

Campaigns help organizations:

- Manage large access reviews.
 - Track certification progress.
 - Send reminders.
 - Monitor completion.
 - Generate reports.
-

Example

Instead of launching:

- 500 separate User Manager certifications

Saviynt launches:

One User Manager Campaign

Inside that campaign:

- Certification 1
- Certification 2
- Certification 3
- ...

This makes management much easier.

Campaign Lifecycle

Every Certification Campaign follows three major stages.

Stage 1 – Identify & Launch

In this stage:

- Decide what needs to be reviewed.
 - Select certifiers.
 - Select campaign owner.
 - Configure campaign settings.
 - Launch the campaign.
-

Stage 2 – Manage

During the campaign:

- Campaign Owner monitors progress.
 - Certifiers perform access reviews.
 - Reminder emails are sent.
 - Pending certifications are tracked.
-

Stage 3 – Review & Complete

The certifier:

- Reviews access.
 - Approves or rejects access.
 - Locks the certification.
 - Generates reports.
 - Access may be revoked automatically if configured.
-

Campaign Workflow

Campaign Created

Campaign Launch Options

During campaign creation, administrators configure:

- Campaign Name
- Campaign Type
- Start Date
- End Date
- Campaign Owner
- Certifiers
- Applications
- Users
- Notification Settings
- Reminder Emails
- Filters

Campaign Preview Mode

Saviynt allows campaigns to run in **Preview Mode**.

Purpose

Preview Mode lets administrators verify:

- Which users will be included.
- Which applications will be reviewed.
- Who the certifiers are.

No real certification starts.

Campaign Active Mode

Once verified,

the campaign is launched in **Active Mode**.

Certifiers begin reviewing access.

Who Participates in a Campaign?

Several people are involved.

Campaign Admin

Creates and configures campaigns.

Responsibilities:

- Create campaigns
 - Configure settings
 - Launch campaigns
 - Monitor progress
-

Campaign Owner

Responsible for the overall campaign.

Responsibilities:

- Monitor progress
 - Send reminders
 - Track completion
 - Manage certifications
-

User Manager (Certifier)

Reviews access for direct reports.

Can:

- Approve access
 - Reject access
 - Lock certification
-

Primary Certifier

Main reviewer.

Can:

- Approve
 - Reject
 - Lock certification
-

Secondary Certifier

Backup reviewer.

Can:

- Review access
- Approve or reject

Cannot lock the certification.

Consultee

A person consulted when the certifier needs assistance.

The consultee provides recommendations.

The final decision is still made by the certifier.

Common Certification Actions

During a review, the certifier can:

- Approve access
 - Reject access
 - Change access end date (conditional approval)
 - Consult another reviewer
 - View history
 - Lock the certification
-

Example Workflow

Employee Access

Manager Reviews

Real Project Example

Company

ABC Bank

Every quarter,

the company launches a **User Manager Certification Campaign**.

Managers review:

- SAP Accounts
- Active Directory Groups
- Office 365 Licenses
- VPN Access

Example:

Rahul moved from Finance to HR.

During certification,

his manager notices Rahul still has SAP Finance access.

The manager rejects that access.

Saviynt automatically creates a revoke task (if configured), and Rahul's unnecessary Finance access is removed.

Advantages of Certifications

- Periodic access reviews.
 - Improved security.
 - Better compliance.
 - Reduced insider risk.
 - Removal of unnecessary access.
 - Strong audit trail.
 - Supports SoD compliance.
 - Helps satisfy external audits.
-

Best Practices

- Schedule certification campaigns regularly (monthly, quarterly, or annually based on business needs).
 - Use Preview Mode before launching campaigns.
 - Assign the correct Campaign Owner and Certifiers.
 - Enable reminder emails to improve completion rates.
 - Configure automatic revoke tasks for rejected access where appropriate.
 - Review high-risk applications more frequently than low-risk applications.
 - Archive campaign reports for audit purposes.
-

Common Issues

Issue	Possible Cause	Solution
Certifier cannot see campaign	Campaign not assigned	Verify certifier assignment
Campaign not starting	Incorrect launch date or inactive configuration	Review campaign schedule
Users missing from campaign	Filters exclude users	Check campaign filters
Revoke task not created	Revoke option not enabled	Enable revoke task configuration
Reminder emails not received	SMTP or notification issue	Verify email templates and SMTP settings

Interview Questions

Q1. What is Certification in Saviynt?

Certification is the periodic review of users, accounts, roles, entitlements, and applications to verify that access is still required.

Q2. Why is Certification important?

It improves security, reduces risk, supports compliance, verifies ownership, and removes unnecessary access.

Q3. What is the difference between Certification and an Access Request?

- **Access Request** grants new access.
 - **Certification** reviews existing access and decides whether to keep or remove it.
-

Q4. What is a Campaign?

A Campaign is a collection of related certifications managed together under a single review process.

Q5. What are the different Certification types in Saviynt?

- User Manager
 - Entitlement Owner
 - Role Owner
 - Application Owner
 - Service Account
 - Organization Owner
 - Self-Certification
-

Q6. Who can lock a certification?

The **Primary Certifier** (or the designated certifier, depending on campaign type) locks the certification after completing the review.

Q7. What is the role of a Consultee?

A Consultee provides advice or recommendations when the certifier needs assistance but does not make the final decision.

Q8. Why is Preview Mode used?

Preview Mode allows administrators to validate campaign configuration and included users before launching the actual certification.

Q9. What happens when access is rejected?

If revoke task configuration is enabled, Saviynt creates a revoke task to remove the rejected access from the target application.

Q10. What are the benefits of using Certification Campaigns?

- Simplified access reviews
 - Better visibility
 - Centralized management
 - Automated reminders
 - Reporting
 - Audit support
 - Improved compliance
-

Quick Revision

- **Certification (Access Review)** verifies that users still need their existing access.
- It helps improve **security**, **compliance**, and **risk management**.

- Common certification types include **User Manager, Entitlement Owner, Role Owner, Application Owner, Service Account, Organization Owner, and Self-Certification.**
- A **Campaign** groups multiple certifications into one review process.
- Campaign lifecycle: **Identify & Launch → Manage → Review & Complete.**
- Main participants are **Campaign Admin, Campaign Owner, Certifier, Primary Certifier, Secondary Certifier, and Consulatee.**
- Common review actions include **Approve, Reject, Consult, Change End Date, and Lock Certification.**
- Rejected access can automatically trigger **revocation tasks** if configured.
- Always use **Preview Mode** before launching campaigns in production.

Module 2 – Trust Modelling

(One of the Most Important Features in Saviynt Certifications)

Introduction

During Access Reviews, managers often need to review **thousands of users and millions of access permissions**.

Reviewing every access manually is:

- Time-consuming
- Error-prone
- Difficult for managers

Saviynt solves this problem using **Trust Modelling**.

Trust Modelling helps managers identify:

- Which access is safe.
- Which access is risky.
- Which access needs attention first.

Instead of reviewing everything equally, managers focus on high-risk access.

What is Trust Modelling?

Definition

Trust Modelling is a Saviynt feature that assigns a **Trust Score** to user access based on predefined trust signals.

Simple Definition

Trust Modelling means:

Saviynt calculates a score that tells how trustworthy a user's access is.

Higher Trust Score = Lower Risk

Lower Trust Score = Higher Risk

Why is Trust Modelling Needed?

Without Trust Modelling:

Manager reviews

5000 access records

↓

Everything looks the same.

Manager doesn't know

Which access is risky?

Which access is normal?

With Trust Modelling

Saviynt highlights:

✓ High Trust Access

✓ Medium Trust Access

✓ Low Trust Access

Managers review risky access first.

Real Example

Rahul

Department

Finance

Access

- SAP Finance
- Outlook
- VPN

These are normal.

Trust Score

95%

Another user

Department

HR

Access

- SAP Finance Admin
- Database Admin
- Linux Root

These accesses are unusual.

Trust Score

25%

Manager immediately investigates.

What is a Trust Score?

A Trust Score is a **numeric value** that represents how trustworthy an access is.

Generally:

- High Score → Low Risk
 - Low Score → High Risk
-

Example

Trust Score	Meaning
90–100	Very High Trust
70–89	High Trust
50–69	Medium Trust
30–49	Low Trust
Below 30	Very High Risk

(Organizations can configure different score ranges.)

What are Trust Signals?

Trust Signals are factors used by Saviynt to calculate the Trust Score.

Examples include:

- Department
- Job Title
- Location
- Manager
- Business Unit
- Role Membership
- Entitlements
- Account Status
- Employee Type
- Organization

Each signal contributes to the overall score.

Example

Rahul

Department

Finance

Title

Financial Analyst

Location

Hyderabad

Business Unit

Banking

These attributes match other Finance employees.

Trust Score increases.

How Trust Modelling Works

User Identity

Collect Trust Signals

Apply Signal Weights

Calculate Trust Score

Store Trust Score

Display During Certification

Trust Signal Weights

Each Trust Signal has a **weight**.

More important signals contribute more to the Trust Score.

Example:

Signal	Weight
Department	30
Job Title	20
Location	15
Manager	15
Business Unit	20

Organizations decide how much importance each signal should have.

Trust Modelling Components

A Trust Model usually includes:

- Trust Signals
 - Signal Weights
 - Trust Score
 - Trust Modelling Job
 - Global Configuration
-

Trust Modelling Job

After configuring the Trust Model,

Saviynt runs the **Trust Modelling Job**.

Purpose:

- Reads user data.
- Evaluates trust signals.
- Calculates Trust Scores.
- Stores results.

Without running this job,

Trust Scores will not appear.

Trust Modelling Workflow

Global Configuration

Navigate to:

Admin

Global Configuration

Intelligence

Enable:

- Trust Modelling
 - Intelligent Recommendations (optional but commonly enabled together)
-

Why Trust Modelling Improves Certifications

Without Trust Modelling:

Manager manually reviews every permission.

With Trust Modelling:

Manager immediately identifies:

- High-risk access
- Unusual access
- Access needing immediate review

This significantly reduces review effort.

Example Certification

Employee

Rahul

Trust Score

96%

Manager reviews quickly and approves.

Employee

Kiran

Trust Score

28%

Manager investigates before approving.

Trust Score During Access Review

During a Certification Campaign,
each access record displays its Trust Score.

Example:

User	Application	Trust Score
Rahul	SAP	96%
Priya	Salesforce	91%
Kiran	SAP Admin	25%

Managers focus on Kiran's access first.

Benefits of Trust Modelling

- Faster certifications.
- Better decision making.
- Reduced manual effort.
- Improved security.

- Easier identification of risky access.
 - Better audit readiness.
 - Increased reviewer confidence.
-

Trust Modelling vs Intelligent Recommendations

Trust Modelling	Intelligent Recommendations
Calculates Trust Scores	Suggests whether access should be approved or rejected
Focuses on risk	Focuses on recommendations
Used during Certifications	Used during Access Requests and Certifications
Displays confidence level of existing access	Uses peer analysis to recommend actions

Complete Workflow

Real Project Example

Company

ABC Bank

Every quarter,

the company launches a Certification Campaign.

Before managers begin reviewing access,

the Trust Modelling Job runs.

Results:

- Rahul – Trust Score 95%
- Priya – Trust Score 92%
- Kiran – Trust Score 28%

Managers immediately review Kiran's access because it appears unusual for someone in the HR department to have Finance Admin privileges.

This reduces review time and improves security.

Advantages

- Reduces certification effort.
- Highlights risky access.
- Improves compliance.
- Provides measurable risk scores.
- Helps managers prioritize reviews.
- Supports intelligent governance.

Best Practices

- Enable Trust Modelling before launching certification campaigns.
 - Choose relevant trust signals (department, title, location, manager, etc.).
 - Assign realistic signal weights based on business importance.
 - Run the Trust Modelling Job whenever user data changes significantly.
 - Review Trust Scores regularly and adjust weights if needed.
 - Use Trust Modelling together with Intelligent Recommendations for better results.
-

Common Issues

Issue	Possible Cause	Solution
Trust Score not displayed	Trust Modelling disabled	Enable Trust Modelling in Global Configuration
Trust Score is empty	Trust Modelling Job not executed	Run the Trust Modelling Job
Incorrect Trust Score	Wrong signal weights or mappings	Review Trust Signals and weights
Managers cannot see scores	Campaign not configured correctly	Verify campaign settings and permissions

Troubleshooting

Trust Score Missing

Check:

- Is Trust Modelling enabled?
- Has the Trust Modelling Job run successfully?
- Are Trust Signals configured?
- Is the Certification Campaign using Trust Scores?

Trust Score Seems Incorrect

Verify:

- Trust Signal mappings.
- Signal weights.
- User attributes imported correctly.
- Latest Trust Modelling Job execution.

Certification Shows No Trust Information

Check:

- Global Configuration.
- Campaign configuration.
- Job status.
- Intelligence settings.

Interview Questions

Q1. What is Trust Modelling?

Trust Modelling is a Saviynt feature that calculates a Trust Score for user access based on configured trust signals.

Q2. Why is Trust Modelling important?

It helps managers identify risky access quickly, reduces manual review effort, and improves certification accuracy.

Q3. What is a Trust Score?

A Trust Score is a calculated value that indicates how trustworthy or risky a user's access is.

Q4. What are Trust Signals?

Trust Signals are user attributes such as department, job title, manager, location, and business unit that are used to calculate the Trust Score.

Q5. What happens if the Trust Modelling Job is not run?

Trust Scores will not be calculated or displayed during certifications.

Q6. Where is Trust Modelling enabled?

Admin → Global Configuration → Intelligence

Q7. Can Trust Modelling automatically approve or reject access?

No. Trust Modelling provides risk information. The final approval or rejection decision is made by the certifier.

Q8. How does Trust Modelling help during Certifications?

It highlights low-trust (high-risk) access so managers can focus on reviewing the most important items first.

Q9. What is the difference between Trust Modelling and Intelligent Recommendations?

Trust Modelling calculates **Trust Scores** based on trust signals, while Intelligent Recommendations analyze peer access patterns and suggest whether access should be approved or rejected.

Q10. What are the benefits of Trust Modelling?

- Faster access reviews
 - Reduced manual effort
 - Better risk visibility
 - Improved compliance
 - More informed certification decisions
-

Quick Revision

- **Trust Modelling** calculates a **Trust Score** for user access.
- **Higher Trust Score = Lower Risk, Lower Trust Score = Higher Risk.**
- Trust Scores are based on **Trust Signals** such as department, title, location, manager, and business unit.
- Configure Trust Modelling under **Admin** → **Global Configuration** → **Intelligence**.
- Run the **Trust Modelling Job** to calculate and update Trust Scores.
- Trust Scores are displayed during **Certification Campaigns** to help managers prioritize reviews.
- Trust Modelling does **not** approve or reject access automatically; it supports the certifier's decision-making.
- Best practice: combine **Trust Modelling** with **Intelligent Recommendations** for more effective access governance.

Module 3 – Intelligent Recommendations in Certifications

(One of the Most Important AI Features in Saviynt)

Introduction

During a Certification Campaign, managers often have to review hundreds or even thousands of user access records.

Reviewing each access manually is:

- Time-consuming
- Error-prone
- Difficult to make consistent decisions

Saviynt solves this using **Intelligent Recommendations**.

Instead of only showing access details, Saviynt analyzes historical access patterns and peer groups, then recommends whether access should be approved or revoked.

What are Intelligent Recommendations?

Definition

Intelligent Recommendations use **Machine Learning (ML)** and **Dynamic Peer Groups** to suggest whether a user's access should be approved or rejected during certifications.

Simple Definition

Saviynt analyzes similar users and recommends whether access should be kept or removed.

The final decision is still made by the certifier.

Why are Intelligent Recommendations Needed?

Without Intelligent Recommendations:

Manager manually reviews:

- SAP Access
- Active Directory Groups
- VPN
- Salesforce
- Database Roles

Every decision depends entirely on the manager's judgment.

With Intelligent Recommendations:

Saviynt analyzes:

- Similar employees
- Similar departments
- Similar job titles
- Similar locations
- Historical approvals

Then provides a recommendation.

Real Example

Rahul

Department

Finance

Job Title

Financial Analyst

Other Finance Analysts have:

- SAP Finance
- Outlook
- VPN

Rahul also has these permissions.

Saviynt recommends:

✓ **Approve Access**

Another example

Kiran

Department

HR

Has:

- SAP Finance Admin
- Database Admin

Very few HR employees have this access.

Saviynt recommends:

✗ **Review Carefully / Reject**

How Intelligent Recommendations Work

User Data

Dynamic Peer Groups

Dynamic Peer Groups

Recommendations are based on **Dynamic Peer Groups**.

Dynamic Peer Groups automatically group users with similar characteristics.

Examples:

- Department
- Job Title
- Manager
- Location
- Business Unit
- Employee Type

Unlike static groups, Dynamic Peer Groups update automatically as employee data changes.

Example

Finance Department

↓

Financial Analyst

↓

Hyderabad

↓

Permanent Employee

Saviynt creates a Dynamic Peer Group using these attributes.

Recommendations are generated using the access patterns of this group.

Recommendation Confidence

Each recommendation includes a **Confidence Score**.

Example:

Confidence	Meaning
95%	Very Strong Recommendation
80%	Strong Recommendation
60%	Moderate Recommendation
40%	Weak Recommendation

Higher confidence means Saviynt has stronger evidence from peer analysis.

Example

Rahul

Recommendation

Approve

Confidence

96%

Manager can confidently approve.

Kiran

Recommendation

Reject

Confidence

93%

Manager investigates before approving.

Recommendation Types

Saviynt can recommend:

- Approve Access
 - Reject Access
 - Review Manually
-

Recommendation Workflow

Enable Intelligent Recommendations

Configure Attributes

Run Recommendations Job

Dynamic Peer Groups Created

Recommendation Job

The **Recommendations Job** generates recommendation rules.

Without running this job:

- No recommendations appear.
- No Dynamic Peer Groups are generated.

Global Configuration

Navigate to:

Admin

Global Configuration

Intelligence

Enable:

- Intelligent Recommendations
- Trust Modelling (recommended)

Important Configuration Settings

1. User Attributes

Select important attributes.

Recommended:

- Department
- Job Title
- Manager
- Location
- Employee Type
- Business Unit
- Organization

Best practice:

Use **5–10 attributes**.

Too many attributes increase processing time without improving accuracy.

2. Confidence Threshold

Defines the minimum confidence required before displaying a recommendation.

Recommended range:

30%–60%

3. Minimum User Threshold

Minimum number of users required to build a recommendation rule.

Recommended:

5–15 users

If only two users match a rule,

Saviynt may not generate recommendations because the sample size is too small.

Recommendations During Certification

During a campaign, managers see:

- User
- Application
- Entitlement
- Trust Score
- Recommendation
- Confidence Score

Example:

User	Application	Recommendation	Confidence
Rahul	SAP	Approve	96%
Priya	Office 365	Approve	92%
Kiran	SAP Admin	Review / Reject	94%

Relationship Between Trust Modelling and Recommendations

Trust Modelling	Intelligent Recommendations
Calculates Trust Score	Suggests Approve/Reject
Shows Risk Level	Shows Recommendation
Uses Trust Signals	Uses Dynamic Peer Groups & ML
Supports Decision	Guides Decision

Most organizations enable both features together.

Real Project Example

Company

ABC Bank

Quarterly Certification Campaign.

Before launching:

Administrator:

- Enables Intelligent Recommendations.
- Configures 7 user attributes.
- Runs Recommendations Job.

Campaign starts.

Manager reviews Rahul.

Recommendation:

Approve

Confidence:

95%

Manager approves immediately.

Manager reviews Kiran.

Recommendation:

Reject

Confidence:

91%

Manager investigates and discovers Kiran retained Finance Admin access after moving to HR.

Access is revoked.

Benefits

- Reduces manual effort.
 - Speeds up certifications.
 - Provides consistent recommendations.
 - Uses AI and Machine Learning.
 - Improves decision quality.
 - Highlights unusual access.
 - Supports compliance.
-

Best Practices

- Enable Intelligent Recommendations before certification campaigns.
 - Use **5–10 meaningful user attributes**.
 - Avoid selecting too many attributes.
 - Configure an appropriate confidence threshold (30–60%).
 - Ensure enough users exist to generate reliable peer groups.
 - Run the Recommendations Job whenever significant identity data changes.
 - Use Intelligent Recommendations together with Trust Modelling.
-

Common Issues

Issue	Possible Cause	Solution
No recommendations displayed	Recommendations disabled	Enable Intelligent Recommendations
Recommendations missing	Recommendations Job not executed	Run the Recommendations Job
Confidence score too low	Too few peer users or poor attribute selection	Adjust attributes and thresholds
Incorrect recommendations	Wrong user attributes or outdated data	Review attribute mapping and rerun the job

Troubleshooting

Recommendations Not Showing

Check:

- Intelligent Recommendations enabled?
- Recommendations Job completed?
- Dynamic Peer Groups generated?
- Minimum User Threshold met?
- Campaign configured correctly?

Confidence Score Too Low

Verify:

- Selected attributes.
- Number of peer users.
- Confidence Threshold.
- Recommendation Rules.

Incorrect Recommendation

Check:

- Peer Group configuration.
- User attributes.
- Historical access data.
- Latest Recommendations Job execution.

Interview Questions

Q1. What are Intelligent Recommendations?

Intelligent Recommendations use Machine Learning and Dynamic Peer Groups to suggest whether user access should be approved or rejected during certifications.

Q2. Do Intelligent Recommendations automatically approve or reject access?

No.

They only provide recommendations.

The final decision is made by the certifier.

Q3. What are Dynamic Peer Groups?

Dynamic Peer Groups automatically group similar users based on attributes such as department, title, manager, location, and employee type.

Q4. Why are Dynamic Peer Groups better than Static Peer Groups?

Dynamic Peer Groups update automatically as user information changes, making recommendations more accurate and reducing manual maintenance.

Q5. What is the purpose of the Recommendations Job?

It analyzes user access, generates Dynamic Peer Groups, creates recommendation rules, and makes recommendations available in certifications.

Q6. Where do you enable Intelligent Recommendations?

Admin → Global Configuration → Intelligence

Q7. What is the recommended number of user attributes?

Generally **5–10 attributes** provide the best balance between accuracy and performance.

Q8. What is the recommended Confidence Threshold?

Typically **30%–60%**, depending on organizational requirements.

Q9. What is the Minimum User Threshold?

It is the minimum number of similar users required before Saviynt generates a recommendation rule. A common recommendation is **5–15 users**.

Q10. What are the benefits of Intelligent Recommendations?

- Faster certifications
 - AI-assisted decision making
 - Reduced manual effort
 - Better consistency
 - Improved security
 - Better compliance
 - Higher reviewer confidence
-

Quick Revision

- **Intelligent Recommendations** use **Machine Learning** and **Dynamic Peer Groups** to recommend whether access should be approved or rejected.
- Recommendations are **suggestions**, not automatic decisions.
- Dynamic Peer Groups group users based on attributes such as **Department, Job Title, Manager, Location, Business Unit, and Employee Type**.
- Enable the feature under **Admin → Global Configuration → Intelligence**.
- Run the **Recommendations Job** to generate recommendation rules.
- Configure:
 - **5–10 user attributes**
 - **Confidence Threshold (30–60%)**
 - **Minimum User Threshold (5–15 users)**
- Use Intelligent Recommendations together with **Trust Modelling** for more effective certification campaigns.
- During certifications, managers see **Trust Scores, Recommendations, and Confidence Scores** to help make informed decisions.

. Module 4 – User Manager Access Review (Overview)

(One of the Most Common Certification Campaigns in Saviynt)

Introduction

In every organization, **Managers are responsible for the access of their team members.**

Managers know:

- Who reports to them.
- Which applications employees use.
- Whether employees still require specific access.

Instead of IT reviewing access,

Saviynt allows **Managers** to review the access of their direct reports.

This is called **User Manager Access Review.**

What is User Manager Access Review?

Definition

User Manager Access Review is a certification campaign where **each manager reviews the access of users reporting directly to them.**

Simple Definition

Managers review and decide whether their employees should continue having certain access or not.

Why is User Manager Access Review Needed?

Organizations constantly change.

Employees:

- Join
- Transfer departments
- Get promoted
- Leave the company

Managers know these changes better than IT.

Therefore, managers are the best people to verify whether access is still required.

Real Example

Rahul reports to **Manager John**.

Rahul has:

- SAP Finance
- Office 365
- VPN
- Salesforce

John reviews Rahul's access.

John decides:

- ✓ SAP → Required
- ✓ Office 365 → Required
- ✓ VPN → Required
- ✗ Salesforce → No longer required

John rejects Salesforce access.

Saviynt can automatically revoke it (if configured).

Why Organizations Use User Manager Reviews

Managers can verify:

- Does the employee still work in the team?
 - Does the employee still require application access?
 - Has the employee changed roles?
 - Has the employee moved to another department?
 - Does the employee still need privileged access?
-

Objectives

The main objectives are:

- Remove unnecessary access
 - Reduce security risks
 - Improve compliance
 - Verify manager ownership
 - Ensure least privilege
 - Support audit requirements
-

What Can Managers Review?

Managers can review:

- User Accounts
- Enterprise Roles
- Business Roles
- Entitlements

- Applications
 - Group Memberships
 - Privileged Access
-

User Manager Certification Workflow

How Does Saviynt Identify the Manager?

Saviynt uses the **Manager attribute** imported from the HR system (Workday, SAP HR, etc.).

Example:

Workday

Rahul

Manager = John

After User Import

Saviynt automatically assigns Rahul's certification to John.

Internal Workflow

HR System

User Import

Manager Mapping

Identity Repository

Certification Campaign

Assigned to Manager

Information Displayed to the Manager

During the review, the manager typically sees:

- Employee Name
- Username
- Department
- Job Title
- Manager
- Application Name
- Account Name

- Enterprise Roles
- Entitlements
- Trust Score
- Intelligent Recommendation
- Confidence Score

This gives enough information to make an informed decision.

Certification Decisions

Managers usually have these options:

1. Approve

Employee still requires the access.

Result:

Access remains.

2. Reject

Employee no longer requires access.

Result:

Access is marked for removal.

If auto-remediation is enabled,

Saviynt creates a deprovisioning task.

3. Delegate (if configured)

Manager delegates the review to another authorized reviewer.

Example:

Manager is on leave.

Certification is delegated to another manager.

4. Consult

Manager asks another person for advice.

Example:

Manager asks the Application Owner:

"Does Rahul still need SAP Finance?"

The Application Owner provides a recommendation.

The final decision remains with the manager.

Trust Score During Review

Managers can see Trust Scores.

Example:

User	Application	Trust Score
Rahul	SAP	96%
Kiran	SAP Admin	25%

Lower Trust Scores indicate higher risk.

Managers usually investigate these first.

Intelligent Recommendations

Saviynt also displays recommendations.

Example:

User	Recommendation	Confidence
Rahul	Approve	95%
Kiran	Reject	91%

Recommendations help managers make faster decisions.

The manager still makes the final decision.

Campaign Lifecycle

Step 1

Administrator creates campaign.

Step 2

Campaign launched.

Step 3

Managers receive notification.

Step 4

Managers review access.

Step 5

Managers approve or reject.

Step 6

Campaign completed.

Step 7

Reports generated.

Example

ABC Bank launches a quarterly campaign.

Manager John receives certifications for:

- Rahul
- Priya
- Kiran

John reviews:

Rahul

✓ SAP

✓ Outlook

✓ VPN

✗ Old Salesforce Role

Rejected.

Saviynt removes Salesforce access after remediation.

Automatic Remediation

If enabled,

Rejected access automatically creates:

Provisioning Task

↓

WSRETRY Job

↓

Target Application

↓

Access Removed

This reduces manual work.

Benefits

- Managers review their own teams.
 - Removes unnecessary access.
 - Improves compliance.
 - Faster certification process.
 - Better security.
 - Reduces orphaned access.
 - Supports audits.
 - Helps enforce least privilege.
-

User Manager Review vs Access Request

User Manager Review	Access Request
Reviews existing access	Requests new access
Manager validates current permissions	User asks for additional permissions
Can revoke access	Can grant access
Periodic activity	On-demand activity

Real Project Example

Company

ABC Bank

Quarterly User Manager Certification Campaign.

Manager John reviews Rahul.

Applications:

- SAP
- Office 365
- VPN
- ServiceNow

John notices Rahul transferred from Finance to HR but still has SAP Finance access.

John rejects SAP Finance.

Saviynt automatically creates a deprovisioning task.

WSRETRY removes SAP Finance access.

Audit report records the action.

Best Practices

- Ensure **Manager Mapping** from the HR system is correct.
 - Launch User Manager campaigns regularly (monthly or quarterly).
 - Enable reminder emails for pending reviews.
 - Use Trust Scores and Intelligent Recommendations to prioritize reviews.
 - Enable automatic remediation for rejected access when appropriate.
 - Review high-risk applications more frequently.
 - Validate campaign scope using Preview Mode before launch.
-

Common Issues

Issue	Cause	Solution
Manager received no certifications	Manager mapping incorrect	Verify HR Manager attribute
Wrong manager received review	Incorrect Manager mapping	Correct HR data and rerun import
Employee missing from campaign	Campaign filters excluded employee	Review campaign scope
Rejected access not removed	Auto-remediation disabled or provisioning failed	Verify remediation settings and provisioning jobs
Trust Score missing	Trust Modelling Job not executed	Run Trust Modelling Job

Troubleshooting

Manager Cannot See Reviews

Check:

- Manager mapping
 - User Import
 - Campaign assignment
 - Campaign filters
-

Wrong Manager Assigned

Verify:

- HR Manager attribute
 - Identity Repository
 - Latest User Import
 - Manager Update Rules
-

Access Not Removed After Rejection

Check:

- Auto-remediation enabled?
 - Provisioning Task created?
 - WSRETRY executed?
 - Connector logs
-

Campaign Empty

Verify:

- Campaign filters
 - User scope
 - Manager assignments
 - Campaign dates
-

Interview Questions

Q1. What is User Manager Access Review?

It is a certification campaign where managers review the access of employees reporting directly to them.

Q2. Why are managers chosen as certifiers?

Managers understand their employees' responsibilities and can determine whether access is still required.

Q3. How does Saviynt know which manager should review a user?

Saviynt uses the **Manager attribute** imported from the HR system.

Q4. What actions can a manager perform during a review?

- Approve
 - Reject
 - Delegate (if enabled)
 - Consult another reviewer
-

Q5. What happens if access is rejected?

If automatic remediation is configured, Saviynt creates a provisioning task to remove the rejected access.

Q6. What information does the manager see during a review?

User details, applications, accounts, roles, entitlements, Trust Score, Intelligent Recommendations, and Confidence Score.

Q7. What is the difference between User Manager Review and Access Request?

User Manager Review validates **existing access**, while Access Request is used to **request new access**.

Q8. Why is Manager Mapping important?

Without correct Manager Mapping, certifications may be assigned to the wrong person or not assigned at all.

Q9. How do Trust Scores help managers?

They identify high-risk access so managers can focus on reviewing those items first.

Q10. What are the benefits of User Manager Access Review?

- Improved security
 - Better compliance
 - Faster reviews
 - Reduced unnecessary access
 - Strong audit support
 - Better governance
-

Quick Revision

- **User Manager Access Review** allows managers to review access for their direct reports.
- Managers are identified using the **Manager attribute** imported from the HR system.
- Managers can **Approve**, **Reject**, **Delegate**, or **Consult** during reviews.
- If **Auto-Remediation** is enabled, rejected access generates provisioning tasks for removal.
- **Trust Scores** and **Intelligent Recommendations** help managers make faster, risk-based decisions.
- User Manager Reviews support **least privilege**, **compliance**, **audit readiness**, and **security**.
- Always verify **Manager Mapping**, **campaign filters**, and **Trust Modelling** before launching a campaign.

Module 5 – User Manager Access Review Configuration

(One of the Most Important Practical & Lab Topics in Saviynt)

Introduction

In Module 4, we learned **what User Manager Access Review is** and **why organizations use it**.

In this module, we will learn **how to configure and launch a User Manager Certification Campaign** in Saviynt.

This is one of the most important **Saviynt Lab** and **implementation** topics.

What is User Manager Campaign Configuration?

Definition

User Manager Campaign Configuration is the process of creating and configuring a certification campaign where managers review the access of their direct reports.

Simple Definition

It is the process of setting up a campaign so that managers can review and certify their employees' access.

Why Configure User Manager Campaigns?

Organizations need to:

- Review user access periodically.
- Meet compliance requirements.
- Remove unnecessary access.
- Improve security.
- Generate audit reports.

Instead of manually assigning reviews, Saviynt automatically sends certifications to the correct managers.

Navigation

Go to:

Admin

Campaigns

Create Campaign

Select:

User Manager Campaign

Steps to Configure User Manager Campaign

Step 1 – Create New Campaign

Provide:

- Campaign Name
- Description

- Campaign Type

Example

Campaign Name

Q1 User Manager Certification

Step 2 – Select Campaign Type

Choose

User Manager Certification

This tells Saviynt that managers will review their direct reports.

Step 3 – Select Review Scope

Choose what managers should review.

Possible options:

- Users
 - Accounts
 - Applications
 - Roles
 - Entitlements
 - Enterprise Roles
 - Business Roles
-

Example

Manager reviews

- SAP Accounts
 - Office 365
 - VPN
 - Active Directory Groups
-

Step 4 – Select Applications

You can review:

All Applications

OR

Specific Applications

Example

- SAP
 - Salesforce
 - Active Directory
 - Office 365
-

Step 5 – Configure Filters

Filters decide which users will be included.

Examples

Department

Finance

Location

Hyderabad

Status

Active

Employee Type

Permanent

Why Filters Are Important

Without filters

Every employee enters the campaign.

With filters

Only selected users are reviewed.

Step 6 – Select Certifiers

For User Manager Campaign

Saviynt automatically assigns

Manager

as Certifier.

Example

Rahul

Manager

John

Certification automatically goes to John.

Step 7 – Primary and Secondary Certifiers

Primary Certifier

Main reviewer.

Can

- Approve
 - Reject
 - Lock Certification
-

Secondary Certifier

Backup reviewer.

Used when

Primary Certifier unavailable.

Can

- Review
- Approve
- Reject

Usually cannot lock the campaign.

Step 8 – Campaign Owner

Campaign Owner manages the campaign.

Responsibilities

- Launch Campaign
 - Monitor Progress
 - Send Reminders
 - View Reports
 - Close Campaign
-

Step 9 – Campaign Schedule

Configure

Start Date

End Date

Reminder Schedule

Expiration Date

Example

Campaign Starts

1 July

Campaign Ends

15 July

Reminder

Every 3 Days

Step 10 – Notification Settings

Saviynt automatically sends emails.

Examples

Campaign Started

Reminder

Campaign Expired

Campaign Completed

Step 11 – Auto Remediation

One of the most important settings.

When enabled

Rejected access

↓

Automatically creates

Provisioning Task

↓

WSRETRY

↓

Access Removed

Example

Manager rejects

SAP Finance

↓

Provisioning Task Created

↓

SAP Connector

↓

SAP Role Removed

Step 12 – Preview Campaign

Before launching

Use

Preview

Purpose

Verify

- Users included
- Managers assigned
- Applications selected
- Filters correct

No real certification starts.

Step 13 – Launch Campaign

After verification

Launch Campaign

Managers immediately receive certification tasks.

Internal Workflow

Campaign Progress

Campaign Owner can monitor:

- Total Certifications
 - Completed Reviews
 - Pending Reviews
 - Rejected Access
 - Approved Access
 - Expired Reviews
-

Campaign Status

Common statuses:

- Draft
 - Preview
 - Active
 - In Progress
 - Completed
 - Expired
 - Closed
-

Review Actions Available

Managers can

- Approve
 - Reject
 - Consult
 - Delegate
 - View User Details
 - View Trust Score
 - View Recommendation
 - Lock Certification
-

Trust Score Integration

During review

Manager sees

Trust Score

Example

Rahul

Trust Score

96%

Easy approval.

Kiran

Trust Score

22%

Manager investigates before approving.

Intelligent Recommendations

Manager also sees

Recommendation

Approve

Confidence

94%

This helps managers make faster decisions.

Real Project Example

Company

ABC Bank

Quarterly Certification Campaign.

Campaign includes

- SAP
- Active Directory
- VPN
- Office 365

Filters

Department

Finance

Only Finance employees included.

Managers receive certifications.

John reviews Rahul.

Approves

- Office 365
- VPN

Rejects

SAP Finance

Auto Remediation enabled.

Provisioning Task created.

WSRETRY executes.

SAP access removed.

Campaign completed.

Audit report generated.

Advantages

- Automatic manager assignment.
 - Easy campaign management.
 - Faster certifications.
 - Automatic reminders.
 - Automatic remediation.
 - Complete audit trail.
 - Compliance support.
 - Reduced manual work.
-

Best Practices

- Always verify **Manager Mapping** before launching a campaign.
- Use **Preview Mode** to validate users, managers, and applications.
- Apply filters carefully to avoid including unnecessary users.
- Enable reminder emails for pending certifications.
- Enable **Auto Remediation** only after proper testing.
- Launch campaigns during periods when managers are available.
- Monitor campaign progress daily until completion.

- Archive campaign reports for audit purposes.
-

Common Configuration Mistakes

Mistake	Result
Wrong Manager Mapping	Certification assigned to wrong manager
No filters	Entire organization included unnecessarily
Preview skipped	Incorrect users included in campaign
Auto Remediation disabled	Rejected access not removed automatically
Reminder emails disabled	Managers forget to complete reviews
Incorrect campaign dates	Campaign expires before completion

Troubleshooting

Manager Received No Certifications

Check

- Manager Mapping
 - Campaign Filters
 - User Import
 - Campaign Assignment
-

Wrong Manager Received Certification

Verify

- HR Manager field
- Identity Repository
- Latest User Import

Campaign Shows No Users

Check

- Filters
 - Active users
 - Campaign scope
 - Selected applications
-

Rejected Access Not Removed

Verify

- Auto Remediation enabled
 - Provisioning Task created
 - WSRETRY Job executed
 - Connector working
-

Reminder Emails Not Sent

Check

- SMTP Configuration
 - Notification Templates
 - Email Queue
 - Campaign Schedule
-

Difference Between Preview and Active Campaign

Preview

Active

Testing mode

Real certification

No emails sent to managers

Managers receive certification tasks

No review performed

Managers review access

Used for validation

Used in production

Interview Questions

Q1. What is the purpose of configuring a User Manager Certification Campaign?

To allow managers to periodically review and certify the access of their direct reports.

Q2. How does Saviynt identify the correct manager?

Using the **Manager attribute** imported from the HR system.

Q3. Why is Preview Mode important?

Preview Mode validates campaign configuration, users, managers, and filters before launching the actual certification.

Q4. What happens when Auto Remediation is enabled?

Rejected access automatically creates provisioning tasks, which remove the access after processing by WSRETRY.

Q5. What is the role of the Campaign Owner?

The Campaign Owner creates, launches, monitors, and manages the certification campaign and reviews its progress.

Q6. What is the difference between a Primary Certifier and a Secondary Certifier?

The **Primary Certifier** performs the main review and can lock the certification, while the **Secondary Certifier** acts as a backup reviewer if needed.

Q7. What information does a manager see during a review?

User details, applications, accounts, roles, entitlements, Trust Score, Intelligent Recommendations, and Confidence Score.

Q8. What happens if a campaign filter is incorrect?

Users may be excluded from or incorrectly included in the certification campaign.

Q9. How do reminder emails help?

They notify managers about pending certifications, improving completion rates before the campaign deadline.

Q10. What should you check if managers are not receiving certification tasks?

Verify Manager Mapping, campaign filters, campaign schedule, user import data, and notification settings.

Quick Revision

- Configure User Manager campaigns under **Admin** → **Campaigns** → **Create Campaign**.
- Select **User Manager Certification** as the campaign type.
- Configure:
 - Campaign Name
 - Review Scope

- Applications
 - Filters
 - Campaign Owner
 - Schedule
 - Notifications
- Managers are assigned automatically based on the **Manager attribute** from the HR system.
- Use **Preview Mode** before launching the campaign.
- Enable **Auto Remediation** to automatically remove rejected access.
- Managers can **Approve**, **Reject**, **Consult**, or **Delegate** during reviews.
- Monitor campaign progress until completion and retain reports for compliance and audits.

Module 6 – Entitlement Owner Access Review (Feature Overview)

(One of the Most Important Certification Campaigns in Saviynt)

Introduction

In **User Manager Certification**, the manager reviews an employee's access.

But sometimes the **Manager may not know whether a specific entitlement (permission/group/role) is still valid.**

The best person to review an entitlement is the **Entitlement Owner**.

Saviynt provides **Entitlement Owner Access Review** to allow entitlement owners to review and certify their own entitlements.

What is an Entitlement?

Definition

An **Entitlement** is a permission, group, role, or privilege that gives access to a specific resource inside an application.

Simple Definition

An entitlement answers the question:

"What permission does this user have?"

Examples

Active Directory

Entitlement

- Finance_Group
 - HR_Group
 - IT_Admin
-

SAP

Entitlement

- SAP_FI_User
 - SAP_MM_Admin
-

AWS

Entitlement

- Administrator
 - Developer
 - ReadOnly
-

What is an Entitlement Owner?

Definition

An Entitlement Owner is the person responsible for managing and reviewing a particular entitlement.

Simple Definition

The Entitlement Owner decides whether an entitlement should continue to exist and who should have it.

Example

Entitlement

Finance_Group

↓

Owner

John

John reviews:

- Is Finance_Group still needed?
 - Which users belong to it?
 - Are child entitlements correct?
-

What is Entitlement Owner Access Review?

Definition

An Entitlement Owner Access Review is a certification campaign where entitlement owners review:

- Entitlements
 - Child Entitlements
 - Users or Accounts associated with those entitlements
-

Simple Definition

Instead of reviewing users,
the owner reviews the **permission itself**.

Why is Entitlement Owner Review Needed?

Sometimes:

- An entitlement is no longer used.
- Too many users have the entitlement.
- Wrong users are assigned.
- The entitlement owner has changed.
- The entitlement should be decommissioned.

This campaign helps identify these issues.

Real Example

Application

Active Directory

Entitlement

Finance_Group

Owner

John

John reviews:

Users:

- Rahul ✓
- Priya ✓
- Kiran ✗

Kiran moved to HR.

John removes Kiran from Finance_Group.

What Does the Entitlement Owner Review?

The owner reviews:

- Parent Entitlement
 - Child Entitlements
 - Users
 - Accounts
 - Memberships
 - Ownership
-

Entitlement Owner Review Process

Login as Entitlement Owner

Review Parent Entitlement

Review Child Entitlements

Review Users / Accounts

Take Action

Lock Certification

Step 1 – Review Parent Entitlement

The owner first verifies:

- Is this entitlement still required?
 - Is the owner correct?
 - Is it active?
-

Example

Finance_Group

Owner

John

John confirms:

✓ Entitlement still required.

Step 2 – Review Child Entitlements

Some entitlements contain child entitlements.

Example

Finance Role

↓

Contains

- Finance_Read
- Finance_Write
- Finance_Reports

The owner reviews all child entitlements.

Step 3 – Review Users and Accounts

Next,

the owner reviews

Which users have this entitlement?

Example

Finance_Group

↓

Users

- Rahul
- Priya
- Kiran

Owner verifies whether each user still needs membership.

Actions Available During Review

Saviynt provides several review actions.

1. Belongs To Me

Use when:

The reviewer confirms they are the correct owner.

Action:

- Enter comments.
- Submit.

Only after selecting **Belongs To Me** are the related accounts and child entitlements displayed for review.

2. Does Not Belong To Me

Use when:

The reviewer is **not** the owner.

Example

Finance_Group

Assigned Owner

John

Actual Owner

David

John selects

Does Not Belong To Me

Saviynt allows reassignment to another certifier (if configured).

3. Decommission

Use when:

The entitlement is no longer needed.

Example

Old_SAP_Project_Group

No longer used.

Owner selects

Decommission

Depending on campaign configuration, Saviynt can:

- Mark the entitlement as inactive.
 - Remove associated accounts from the entitlement.
-

4. Consult

Use when:

The owner needs another person's opinion.

Example

John asks:

"Should Rahul still have Finance_Group?"

A colleague provides advice.

Final decision remains with the owner.

5. History

Displays:

- Previous certification decisions
- Approval history
- Comments
- Earlier actions

Useful during audits.

Internal Workflow

Campaign Created

Assigned to Entitlement Owner

Review Parent Entitlement

Review Child Entitlements

Review Users / Accounts

Approve / Decommission /
Reassign / Consult

Lock Certification

Intelligent Recommendations

Entitlement Owner campaigns support:

- Savi AI
- Intelligent Recommendations

Recommendations help reviewers make faster decisions.

The final decision is still made by the reviewer.

Trust Score

During review,

the owner can also see:

- Trust Score
- Recommendation
- Confidence Score

This helps identify risky entitlements.

Real Project Example

Company

ABC Bank

Application

Active Directory

Entitlement

Finance_Group

Owner

John

Campaign launched.

John reviews.

Users

Rahul ✓

Priya ✓

Kiran ✗

Kiran transferred to HR.

John removes Kiran from Finance_Group.

John notices

Old_Project_Group

is no longer used.

He selects

Decommission.

Saviynt marks the entitlement inactive (based on campaign configuration) and can remove associated accounts if configured.

Benefits

- Reviews entitlement ownership.
 - Removes obsolete entitlements.
 - Reduces security risks.
 - Cleans up unused permissions.
 - Improves compliance.
 - Maintains accurate ownership.
 - Supports audits.
-

Difference Between User Manager and Entitlement Owner Review

User Manager Review	Entitlement Owner Review
Manager reviews users	Owner reviews entitlements
Focus on employee access	Focus on permissions and groups
Certifier is Manager	Certifier is Entitlement Owner
Reviews all user access	Reviews one entitlement and its memberships

Best Practices

- Assign the correct Entitlement Owner.
- Review high-risk entitlements regularly.
- Use **Decommission** only after confirming the entitlement is no longer required.
- Review child entitlements before making decisions.
- Use **Consult** when additional expertise is needed.
- Use **History** to understand previous certification decisions.
- Enable Intelligent Recommendations to assist reviewers.

Common Issues

Issue	Cause	Solution
Wrong owner received certification	Incorrect ownership mapping	Update entitlement ownership
Users missing from review	Campaign scope or filters	Review campaign configuration
Cannot reassign entitlement	Reassignment not enabled	Enable reassignment in campaign settings
Decommission not working	Decommission option not configured	Review campaign configuration
Recommendations missing	Recommendations Job not executed	Run Recommendations Job

Troubleshooting

Wrong Entitlement Owner

Check:

- Entitlement ownership
 - Campaign configuration
 - Identity Repository
-

Child Entitlements Not Displayed

Verify:

- Parent entitlement selected as **Belongs To Me**
- Child entitlement configuration
- Import data

Decommission Action Not Working

Check:

- Campaign decommission settings
 - Entitlement status
 - Provisioning configuration
-

Reassign Option Missing

Verify:

- **Enable Reassignment for Certifier**
 - Campaign settings
 - Reviewer permissions
-

Interview Questions

Q1. What is an Entitlement Owner Access Review?

It is a certification campaign where entitlement owners review entitlements, child entitlements, and associated users or accounts.

Q2. Who performs the review?

The **Entitlement Owner**.

Q3. What is reviewed?

- Parent Entitlements
- Child Entitlements
- Users

- Accounts
 - Memberships
-

Q4. What does Belongs To Me mean?

The reviewer confirms they are the correct owner of the entitlement and proceeds with the review.

Q5. When should Does Not Belong To Me be used?

When the reviewer is not the correct owner of the entitlement and needs to reassign it (if configured).

Q6. What happens when Decommission is selected?

Depending on campaign configuration, the entitlement can be marked inactive and associated accounts can be removed from that entitlement.

Q7. What is the purpose of the Consult option?

It allows the reviewer to request advice from another user before making the final certification decision.

Q8. What does the History option show?

Previous certification actions, comments, and decisions related to the entitlement.

Q9. Can Intelligent Recommendations be used in Entitlement Owner campaigns?

Yes. Intelligent Recommendations and Savi AI can assist reviewers by suggesting certification decisions.

Q10. What are the benefits of Entitlement Owner Reviews?

- Correct entitlement ownership
 - Removal of obsolete permissions
 - Improved compliance
 - Better security
 - Cleaner entitlement structure
 - Stronger audit readiness
-

Quick Revision

- **Entitlement Owner Access Review** is used to review **entitlements**, not users.
- The reviewer verifies:
 - Parent Entitlement
 - Child Entitlements
 - Users and Accounts associated with the entitlement.
- Available actions:
 - **Belongs To Me**
 - **Does Not Belong To Me**
 - **Decommission**
 - **Consult**
 - **History**
- **Decommission** can inactivate an entitlement and optionally remove associated accounts, depending on campaign settings.
- Campaigns support **Savi AI**, **Intelligent Recommendations**, and **Trust Scores** to assist reviewers.
- Best practice: review ownership regularly and decommission only after confirming the entitlement is no longer required.

Module 7 – Entitlement Owner Access Review (Configuration Overview)

(One of the Most Important Practical & Lab Topics in Saviynt)

Introduction

In **Module 6**, we learned:

- What an Entitlement Owner Access Review is
- Why organizations use it
- The review process
- Available review actions

In this module, we will learn **how to configure and launch an Entitlement Owner Certification Campaign**.

This is a common **Saviynt implementation** and **Lab 8** topic.

What is Entitlement Owner Campaign Configuration?

Definition

Entitlement Owner Campaign Configuration is the process of creating a certification campaign where **Entitlement Owners review the entitlements, child entitlements, and associated user accounts**.

Simple Definition

It is the process of setting up a campaign so entitlement owners can review and certify the permissions they own.

Why Configure Entitlement Owner Campaigns?

Organizations use these campaigns to:

- Verify entitlement ownership.
 - Remove unused entitlements.
 - Review users assigned to entitlements.
 - Improve compliance.
 - Reduce security risks.
 - Support audit requirements.
-

Navigation

Go to:

Admin

Campaigns

Create Campaign

Select:

Entitlement Owner Campaign

Configuration Workflow

Login as Campaign Admin

Create Entitlement Owner Campaign

Step 1 – Login as Campaign Admin

The administrator logs in and creates a new certification campaign.

Only authorized users can create certification campaigns.

Step 2 – Create Entitlement Owner Campaign

Enter:

- Campaign Name
- Description
- Campaign Type

Example

Quarterly Entitlement Owner Review

Step 3 – Add Campaign Details

Configure:

- Campaign Name
- Description
- Campaign Type
- Start Date
- End Date

Example

Campaign Name

Finance Entitlement Certification

Step 4 – Configure Ownership

This is one of the most important steps.

Saviynt automatically assigns each entitlement to its configured **Entitlement Owner**.

Example

Finance_Group

↓

Owner

John

John receives the certification.

Step 5 – Configure Access Review

Choose what reviewers should review.

Possible review objects:

- Parent Entitlements
 - Child Entitlements
 - User Accounts
 - Memberships
-

Step 6 – Configure Notifications

Saviynt automatically sends emails.

Examples

- Campaign Started
 - Reminder
 - Consultation Request
 - Reassignment
 - Campaign Completed
-

Step 7 – Select Certifiers

The certifier is normally the **Entitlement Owner**.

If ownership is missing,

a fallback certifier can be configured.

Step 8 – Configure Campaign Filters (Optional)

Filters reduce campaign scope.

Examples

Department

Finance

Application

Active Directory

Status

Active

Business Unit

Corporate Banking

Using filters helps avoid reviewing unnecessary entitlements.

Step 9 – Revoke Task Configuration

This is a very important setting.

If configured,

when an entitlement or membership is rejected,

Saviynt automatically creates a **Revoke Task**.

Workflow

Reject

Revoke Task Created

Provisioning Job

Access Removed

Step 10 – Intelligent Recommendations

Campaigns support:

- Savi AI
- Intelligent Recommendations

These features suggest certification decisions using peer analysis and AI.

The reviewer still makes the final decision.

Step 11 – Launch Mode

Campaigns can be launched in two modes.

Preview Mode

- Testing only
 - No emails sent
 - Validate configuration
-

Active Mode

- Real certification
 - Notifications sent
 - Review begins immediately
-

Step 12 – Schedule Campaign

Campaigns can be:

- Started immediately
- Scheduled for a future date

Example

Start Date

1 July

End Date

15 July

Reminder

Every 3 days

Step 13 – Save as Template

If similar campaigns run regularly,
save the configuration as a template.

Benefits:

- Faster future campaigns
 - Consistent configuration
 - Less manual work
-

Internal Workflow

Campaign Created

Entitlements Identified

Owners Mapped

Notifications Sent

Owner Reviews

Real Project Example

Company

ABC Bank

Application

Active Directory

Entitlement

Finance_Group

Owner

John

Administrator launches the quarterly campaign.

John receives the certification.

He reviews:

Users

- Rahul ✓
- Priya ✓
- Kiran ✗

Kiran moved to HR.

John rejects Kiran's membership.

He also notices an old entitlement called **Legacy_Finance_Group** that is no longer used.

He selects **Decommission**.

Saviynt creates the revoke task (based on configuration), updates the entitlement status, and records the certification for audit purposes.

Campaign Progress

Campaign Owner monitors:

- Total Entitlements
 - Pending Reviews
 - Completed Reviews
 - Rejected Items
 - Decommissioned Entitlements
 - Expired Reviews
-

Benefits

- Automatic owner assignment.
 - Reviews entitlement ownership.
 - Removes obsolete entitlements.
 - Supports compliance.
 - Reduces manual effort.
 - Generates complete audit records.
 - Can reuse templates for recurring campaigns.
-

Best Practices

- Assign an Entitlement Owner for every entitlement.
- Verify ownership before launching campaigns.
- Use **Preview Mode** before production.
- Enable reminder emails.
- Configure **Revoke Tasks** carefully.

- Use campaign filters to reduce unnecessary reviews.
 - Save frequently used campaigns as templates.
 - Enable Savi AI and Intelligent Recommendations where appropriate.
-

Common Configuration Mistakes

Mistake	Result
No Entitlement Owner assigned	Campaign cannot assign reviewers correctly
Wrong owner mapping	Certification sent to the wrong person
Filters not configured	Too many entitlements included
Preview skipped	Configuration issues appear in production
Revoke task not configured	Rejected access is not automatically removed
Notifications disabled	Reviewers may miss certification deadlines

Troubleshooting

Campaign Not Assigned

Check:

- Entitlement Owner mapping
 - Campaign filters
 - Entitlement import
 - Campaign configuration
-

Wrong Owner Received Campaign

Verify:

- Entitlement ownership
 - Identity Repository
 - Imported ownership attributes
-

Revoke Task Not Created

Check:

- Revoke Task Configuration
 - Provisioning settings
 - Connector status
 - WSRETRY Job
-

Notifications Not Sent

Verify:

- SMTP configuration
 - Email templates
 - Notification schedule
 - Mail queue
-

Campaign Shows No Entitlements

Check:

- Campaign filters
 - Imported entitlements
 - Ownership mappings
 - Application scope
-

Preview vs Active Mode

Preview Mode

Active Mode

Testing only	Production campaign
No notifications	Notifications sent
No certification actions	Real certification actions
Used to validate configuration	Used for actual access reviews

Interview Questions

Q1. What is an Entitlement Owner Campaign?

It is a certification campaign where entitlement owners review entitlements, child entitlements, and associated user accounts.

Q2. Who creates the campaign?

A Campaign Admin.

Q3. Who performs the review?

The configured **Entitlement Owner**.

Q4. Why are campaign filters used?

Filters reduce the campaign scope by including only the required entitlements, applications, or users.

Q5. What is the purpose of Preview Mode?

To validate campaign configuration before launching the actual certification.

Q6. What happens when Revoke Task Configuration is enabled?

Rejected access generates a revoke task that removes the access after provisioning.

Q7. Can campaigns be scheduled?

Yes. Campaigns can be launched immediately or scheduled for a future date.

Q8. Why save a campaign as a template?

To reuse the same configuration for future certification campaigns, reducing setup time and ensuring consistency.

Q9. What happens if an Entitlement Owner is missing?

The campaign may not assign the certification correctly unless a default or fallback certifier is configured.

Q10. Can Intelligent Recommendations be used in Entitlement Owner Campaigns?

Yes. Savi AI and Intelligent Recommendations can assist reviewers with suggested decisions, while the final approval remains with the reviewer.

Lab 8 – Entitlement Owner Campaign (Common Questions)

Q1. After creating an Entitlement Owner Campaign, why don't any reviewers receive certifications?

Answer: Check that entitlements have valid owners assigned, verify campaign filters, and ensure the campaign is launched in **Active** mode rather than **Preview** mode.

Q2. Why is the Decommission option unavailable?

Answer: The campaign was not configured with the appropriate **Decommission Action** during creation.

Q3. A reviewer says, "This entitlement does not belong to me." What should they do?

Answer: Select **Does Not Belong To Me** to reassign the entitlement to the correct owner (if reassignment is enabled).

Q4. Why should you always run the campaign in Preview first?

Answer: To verify owner mappings, campaign scope, filters, and notifications before affecting production users.

Quick Revision

- **Campaign Admin** creates the Entitlement Owner Campaign.
- **Entitlement Owners** review:
 - Parent Entitlements
 - Child Entitlements
 - User Accounts and Memberships.
- Configure:
 - Ownership
 - Notifications
 - Filters
 - Revoke Tasks
 - Schedule
- Campaigns support **Savi AI** and **Intelligent Recommendations**.
- Use **Preview Mode** for testing and **Active Mode** for production.
- Save reusable configurations as **Campaign Templates**.
- Best practice: ensure ownership mappings are accurate and configure automatic revoke tasks where appropriate.

Module 8 – Application Owner Access Review (Process & Configuration)

(One of the Most Important Certification Campaigns in Saviynt)

Introduction

In previous modules, we learned:

- User Manager Certification
- Entitlement Owner Certification

Now we'll learn **Application Owner Certification**.

Sometimes, **the manager doesn't know who should have access to an application**.

For example:

- Salesforce
- SAP
- ServiceNow
- AWS
- Oracle

The person who knows the application best is the **Application Owner**.

Therefore, Saviynt allows **Application Owners** to review access for their applications.

What is an Application Owner?

Definition

An Application Owner is the person responsible for managing an application's security, users, and access.

Simple Definition

Application Owner is the person responsible for deciding who should have access to an application.

Examples

Application	Application Owner
SAP	SAP Administrator
Salesforce	Salesforce Administrator
AWS	Cloud Administrator
ServiceNow	ServiceNow Administrator
Oracle	Oracle Administrator

What is Application Owner Access Review?

Definition

Application Owner Access Review is a certification campaign where the Application Owner reviews:

- User Accounts
- Entitlements
- Roles

for their application.

Simple Definition

The Application Owner reviews all users and permissions belonging to their application.

Why is Application Owner Review Needed?

Managers know employees.

Application Owners know applications.

Application Owners understand:

- Which users need access.
 - Which roles are valid.
 - Which permissions are unnecessary.
 - Which accounts should be removed.
-

Real Example

Application

Salesforce

↓

Owner

Salesforce Administrator

Users

- Rahul
- Priya
- Kiran

Roles

- Sales User

- Marketing User
- System Administrator

The Application Owner verifies whether each user still requires these roles.

What Does the Application Owner Review?

The Application Owner reviews:

- Base Accounts
- User Accounts
- Roles
- Entitlements

The exact review items depend on what was selected during campaign creation.

Application Owner Certification Process

Login as Application Owner

Review Base Accounts

Review Roles

Review Entitlements

Approve / Reject

Submit Review

Base Accounts

What are Base Accounts?

Base Accounts are the user accounts that exist in the application.

Example

Salesforce

Accounts

- Rahul
- Priya
- Kiran

The Application Owner verifies whether these accounts are still required.

Review Roles

Application Owners review application-specific roles.

Example

Salesforce Roles

- Sales User
- Marketing User
- System Administrator

Questions asked:

- Is this role still required?
 - Should this role be removed?
-

Review Entitlements

Application Owners review application permissions.

Example

AWS

Entitlements

- ReadOnly
- Developer
- Administrator

The owner verifies whether users still require these permissions.

Actions Available

During review,

Application Owners can:

Approve

Access is still required.

Access remains.

Reject

Access no longer required.

If automatic remediation is enabled,

Saviynt creates a revoke task.

Consult

Consult another expert before making a decision.

Example

Salesforce Administrator consults Security Team.

View History

Review previous certification actions.

Useful during audits.

Lock Certification

After completing the review,

the Application Owner locks the certification.

Application Owner Campaign Configuration

Configuration is performed by the **Campaign Admin**.

Step 1 – Login as Campaign Admin

Administrator logs into Saviynt.

Step 2 – Create Application Owner Campaign

Create

Application Owner Campaign.

Enter

- Campaign Name
- Description
- Campaign Type

Example

Quarterly Salesforce Certification

Step 3 – Configure Campaign

Configure

- Ownership
- Access Review Steps
- Items Included

Select what reviewers will review.

Examples

- Accounts
 - Roles
 - Entitlements
-

Step 4 – Configure Revoke Task

Very important.

If enabled

↓

Rejected Access

↓

Revoke Task

↓

Provisioning

↓

Access Removed

Step 5 – Configure Notifications

Saviynt sends

- Campaign Started
 - Reminder
 - Campaign Completed
 - Consultation Requests
-

Step 6 – Select Certifier

Normally

Application Owner

becomes

Certifier.

Step 7 – Configure Filters

Filters reduce campaign scope.

Examples

Application

Salesforce

Department

Sales

Status

Active

Filters improve campaign performance.

Step 8 – Intelligent Recommendations

Application Owner campaigns support

- Savi AI
- Intelligent Recommendations

These provide suggested decisions for reviewers.

Step 9 – Launch Campaign

Two modes

Preview Mode

Testing only.

No emails sent.

Active Mode

Production.

Notifications sent.

Certification begins.

Step 10 – Schedule Campaign

Campaign can

Start Immediately

OR

Start Later

Example

Start

1 July

End

15 July

Step 11 – Save Template

Campaign configuration can be saved.

Benefits

- Reuse later
 - Consistency
 - Faster setup
-

Internal Workflow

Real Project Example

Company

ABC Bank

Application

Salesforce

Owner

Salesforce Administrator

Campaign launched.

Users reviewed

- Rahul

- Priya
- Kiran

Rahul

Sales User

✓ Approved

Priya

Marketing User

✓ Approved

Kiran

System Administrator

✗ Rejected

Saviynt creates a revoke task.

Provisioning removes the System Administrator role.

Audit report records the change.

Application Owner Review vs User Manager Review

User Manager	Application Owner
Reviews employees	Reviews application
Knows employee responsibilities	Knows application security
Reviews all user access	Reviews application-specific access
Manager is certifier	Application Owner is certifier

Benefits

- Better application governance.
 - Removes unnecessary application access.
 - Improves security.
 - Supports compliance.
 - Reduces privileged access.
 - Creates audit evidence.
 - Faster reviews.
-

Best Practices

- Assign a valid Application Owner for every onboarded application.
 - Launch campaigns quarterly or based on business policy.
 - Enable Intelligent Recommendations.
 - Configure automatic revoke tasks.
 - Use Preview Mode before production.
 - Apply filters to reduce campaign size.
 - Review privileged applications (SAP, AWS, AD) more frequently.
 - Save commonly used campaigns as templates.
-

Common Configuration Mistakes

Mistake	Result
No Application Owner assigned	Campaign cannot assign certifications
Wrong owner	Wrong person receives review
No filters	Large unnecessary campaign
Preview skipped	Production configuration errors
Revoke Task disabled	Rejected access remains active
Notifications disabled	Reviewers miss certification deadlines

Troubleshooting

Application Owner Didn't Receive Campaign

Check

- Application Owner mapping
 - Campaign configuration
 - Filters
 - Launch status
-

Campaign Shows No Users

Check

- Application filters
 - Imported accounts
 - Campaign scope
-

Revoke Task Not Created

Check

- Revoke Task configuration
 - Provisioning Job
 - WSRETRY
 - Connector
-

Recommendations Missing

Verify

- Intelligent Recommendations enabled
- Recommendations Job completed
- Trust Modelling enabled

Campaign Empty

Verify

- Imported accounts
 - Imported entitlements
 - Campaign filters
 - Application ownership
-

Interview Questions

Q1. What is an Application Owner Access Review?

It is a certification campaign where the Application Owner reviews user accounts, roles, and entitlements for a specific application.

Q2. Who performs the review?

The **Application Owner**.

Q3. What does the Application Owner review?

- Base Accounts
 - User Accounts
 - Roles
 - Entitlements
-

Q4. Why is an Application Owner better suited for this review?

Because the Application Owner understands the application's security model, roles, and permissions better than a user's manager.

Q5. What happens if access is rejected?

If automatic remediation is configured, Saviynt creates a revoke task and removes the access after provisioning.

Q6. Can Intelligent Recommendations be used?

Yes.

Application Owner campaigns support **Savi AI** and **Intelligent Recommendations**.

Q7. What is the purpose of Preview Mode?

To validate campaign configuration before launching it in production.

Q8. What information can be included in the review?

Accounts, roles, and entitlements based on the campaign configuration.

Q9. What is the role of the Campaign Admin?

The Campaign Admin creates, configures, schedules, launches, and monitors the Application Owner Campaign.

Q10. What are the benefits of Application Owner Reviews?

- Better application governance
 - Improved compliance
 - Stronger security
 - Reduced unnecessary access
 - Better audit support
 - Faster certification process
-

Lab 8 – Application Owner Campaign

Q1. After launching the campaign, no Application Owner received certifications.

Answer

Check:

- Application Owner assignment
 - Campaign filters
 - Imported accounts
 - Campaign launched in **Active Mode**
-

Q2. Why are no roles displayed during review?

Answer

The required review items (roles/entitlements) were not selected during campaign configuration.

Q3. Why is access not removed after rejection?

Answer

Verify:

- Revoke Task configuration
 - Provisioning Job
 - WSRETRY
 - Connector
-

Q4. Why should Application Owner campaigns use Intelligent Recommendations?

Answer

They help reviewers make faster and more consistent certification decisions by providing AI-assisted recommendations based on historical access patterns and peer analysis.

Quick Revision

- **Application Owner Access Review** allows the Application Owner to certify **accounts, roles, and entitlements** for a specific application.
- The campaign is created by the **Campaign Admin**.
- The **Application Owner** acts as the certifier.
- Configuration includes:
 - Ownership
 - Review items
 - Notifications
 - Revoke Task
 - Filters
 - Schedule
- Campaigns support **Savi AI** and **Intelligent Recommendations**.
- Use **Preview Mode** before production and **Active Mode** for real certifications.
- Best practice: ensure every application has a valid owner and enable automatic remediation for rejected access where appropriate.

Module 9 – Miscellaneous Features

(Important for Labs, Administration, and Interviews)

Introduction

After learning how to create and manage certification campaigns, Saviynt provides several additional features that help administrators:

- Notify reviewers
- Download reports
- Track campaign progress
- Configure global settings
- Reuse campaign configurations

These features simplify certification management and improve audit readiness.

Topics Covered

This module explains:

- Email Templates
 - Notification Reminders
 - Certification Reports
 - Analytics & Intelligence Reports
 - Global Configuration
 - Campaign Templates
 - Download Reports
 - Discontinue Campaign
 - Best Practices
-

1. Email Templates

What are Email Templates?

Email Templates define the emails sent automatically during different stages of a certification campaign.

Simple Definition

Email Templates are predefined messages automatically sent to users during certification campaigns.

Why are Email Templates Needed?

Without email notifications,

reviewers may:

- Forget reviews
- Miss deadlines
- Delay campaign completion

Email templates improve completion rates.

Types of Notifications

Saviynt can send emails when:

- Campaign Created
 - Campaign Started
 - Reminder
 - Consultation Requested
 - Reassigned
 - Campaign Completed
 - Campaign Discontinued
-

Reminder Notifications

One of the most useful features.

Saviynt supports **multiple reminder levels** (for example, periodic reminders before the campaign ends).

Example

Campaign starts

↓

Reviewer does not review

↓

Reminder Email

↓

Still pending

↓

Another Reminder

↓

Campaign closes

Example

Manager John receives:

Subject

Certification Pending

Message

Please review pending certifications before 15 July.

Benefits

- Reduces overdue reviews
 - Improves compliance
 - Reduces manual follow-up
 - Faster campaign completion
-

2. Certification Reports

What are Certification Reports?

Certification Reports contain complete information about certification campaigns.

They help:

- Administrators
- Auditors
- Compliance Teams

review campaign results.

Why Reports are Needed

Reports answer questions like:

- Who approved access?
 - Who rejected access?
 - Which users were reviewed?
 - Which entitlements were removed?
 - Which campaigns are complete?
-

Types of Reports

1. Campaign List Report

Contains

- Completed campaigns
- Campaign summary

Useful for management.

2. Certification Report

Contains

- Individual certification decisions
 - Reviewer comments
 - Approvals
 - Rejections
-

3. Campaign Detail Report

The most detailed report.

Contains:

- User
- Account
- Entitlement
- Decision
- Reviewer
- Comments
- Date
- Audit information

This is the report auditors usually request.

Export Reports

Saviynt allows:

Export Single Certification

OR

Export Multiple Certifications

Reports can be downloaded after campaign completion.

Report Workflow

Campaign Completed

Open Campaign

Select Report

Export

CSV / Excel

3. Analytics & Intelligence Reports

Saviynt's **Analytics Module** provides advanced reporting.

Administrators can create reports using queries.

Reports include:

- Campaign Reports
- User Reports
- Entitlement Reports

- Certification Reports
 - Audit Reports
-

Export Formats

Reports can be exported as:

- CSV
- Excel

Administrators can also:

- View report history
 - Re-run reports
-

Why Analytics Reports are Useful

Analytics helps organizations:

- Track campaign completion
 - Identify pending reviews
 - Detect risky access
 - Measure compliance
 - Prepare audit evidence
-

4. Global Configuration

Global Configuration stores system-wide certification settings.

Examples:

- Report settings
- Notification settings
- Default campaign settings
- System reporting options

These settings affect all certification campaigns.

Example

Global Configuration controls:

- Email notifications
 - Reminder schedules
 - Report generation
 - Default behavior
-

5. Campaign Templates

What is a Campaign Template?

A Campaign Template is a saved campaign configuration.

Instead of creating a campaign again,

Saviynt allows administrators to reuse an existing configuration.

Simple Definition

Campaign Template = Saved Campaign Configuration

Example

Quarterly User Manager Campaign

Instead of recreating:

- Filters

- Notifications
- Schedule
- Review Scope

Administrator simply selects:

Quarterly User Manager Template

Everything is loaded automatically.

Benefits

- Saves time
 - Standardizes campaigns
 - Reduces configuration errors
 - Faster deployment
-

6. Download Certification Reports

One of the Lab 8 activities.

Administrators can download:

- Campaign Summary
 - Campaign Details
 - Certification Details
-

Example

Quarterly Campaign

↓

Completed

Export

Excel Report

Sent to Auditor

7. Discontinue Campaign

Sometimes a campaign must be stopped before completion.

Reasons:

- Wrong campaign
- Wrong users included
- Incorrect configuration
- Duplicate campaign
- Business requirement changed

Lab 8 includes discontinuing a campaign.

What Happens When a Campaign is Discontinued?

- Campaign stops.
 - New certification actions cannot continue.
 - Status changes to **Discontinued**.
 - Reports remain available for historical reference.
-

Internal Workflow

Real Project Example

Company

ABC Bank

Quarterly Certification Campaign.

After launch,

Administrator discovers:

Wrong department included.

Campaign discontinued.

Configuration corrected.

New campaign launched.

Managers receive correct certifications.

Lab 8 Activities

Common Lab activities include:

Use Case 6

Download Certification Reports.

Steps:

- Open completed campaign.
 - Export summary.
 - Export detailed report.
 - Save report.
-

Use Case 7

Discontinue Campaign.

Steps:

- Open campaign.
 - Select Discontinue.
 - Verify status changes.
 - Confirm campaign stops.
-

Benefits of Miscellaneous Features

- Better communication.
 - Faster campaign completion.
 - Easy report generation.
 - Better audit support.
 - Reusable templates.
 - Easier administration.
 - Improved compliance.
-

Best Practices

- Configure reminder emails before launching campaigns.
- Use meaningful email templates.

- Download campaign reports after completion.
 - Retain reports for audit purposes.
 - Save frequently used campaigns as templates.
 - Review Global Configuration regularly.
 - Discontinue incorrect campaigns instead of modifying active campaigns.
-

Common Issues

Issue	Cause	Solution
No reminder emails	SMTP or notification configuration issue	Verify email templates and SMTP settings
Reports cannot be exported	Missing permissions or campaign incomplete	Verify role permissions and campaign status
Campaign template missing	Template not saved	Save configuration as a template
Wrong users in campaign	Incorrect filters	Discontinue campaign and recreate it
Analytics report empty	Incorrect query or missing data	Review report configuration and source data

Troubleshooting

Email Notifications Not Sent

Check:

- SMTP configuration
 - Email templates
 - Notification schedule
 - Email queue
-

Reports Not Downloading

Verify:

- User permissions
 - Campaign completed
 - Export permissions
 - Browser download settings
-

Campaign Template Not Available

Check:

- Template saved successfully
 - Template permissions
 - Campaign type
-

Campaign Needs to Be Cancelled

Instead of editing a running campaign:

- Discontinue the campaign.
 - Correct configuration.
 - Launch a new campaign.
-

Interview Questions

Q1. What are Email Templates in Saviynt?

Predefined notification emails automatically sent during certification campaigns.

Q2. Why are reminder emails important?

They remind reviewers to complete pending certifications before campaign deadlines.

Q3. What types of reports can Saviynt generate?

- Campaign Reports
- Certification Reports
- Campaign Detail Reports
- Analytics Reports

Q4. Which is the most detailed certification report?

Export Single Campaign (Campaign Detail Report) because it includes approvals, rejections, reviewers, users, entitlements, and comments.

Q5. What formats are supported for report export?

- CSV
- Excel

Q6. What is a Campaign Template?

A reusable saved campaign configuration.

Q7. Why use Campaign Templates?

They save time, reduce errors, and ensure consistency across recurring campaigns.

Q8. When should a campaign be discontinued?

When it contains incorrect users, incorrect configuration, duplicate setup, or business requirements change.

Q9. What is the purpose of the Analytics Module?

To generate advanced reports and provide visibility into campaign results, compliance, and certification progress.

Q10. What should you do if reports cannot be exported?

Verify user permissions, ensure the campaign is completed, and check export configuration.

Lab 8 Questions

Q1. Where do you download Certification Reports?

Answer:

Open the completed campaign and use the export option to download summary or detailed reports.

Q2. Which report should be shared with auditors?

Answer:

The **Campaign Detail Report (Export Single Campaign)** because it contains complete certification details.

Q3. Why would you discontinue a campaign?

Answer:

Because of incorrect filters, wrong users, duplicate campaigns, or configuration mistakes.

Q4. Why save campaigns as templates?

Answer:

To reuse the same configuration for future campaigns without recreating all settings.

Quick Revision

- **Email Templates** automatically notify reviewers about campaign events.
- **Reminder Notifications** help reviewers complete certifications on time.
- **Certification Reports** include campaign summaries and detailed certification information.
- **Campaign Detail Report** is the most comprehensive report and is commonly used for audits.
- Reports can be exported in **CSV** or **Excel** format.
- The **Analytics Module** provides advanced reporting and campaign analysis.
- **Global Configuration** manages system-wide certification settings.
- **Campaign Templates** allow administrators to reuse certification configurations.
- **Discontinue Campaign** is used to stop incorrectly configured or unnecessary campaigns while preserving historical records.
- These features are frequently used in **Lab 8**, especially **Downloading Certification Reports** and **Discontinuing Campaigns**.

Module 10 – Best Practices & Troubleshooting

(One of the Most Important Interview and Production Support Modules)

Introduction

After learning how to create and manage certification campaigns, it is equally important to know:

- Best practices for certification campaigns
- Common production issues
- Troubleshooting methods
- Real support scenarios

This module is especially important for **L2/L3 Support, Implementation Engineers**, and **Saviynt Interviews**.

Why Best Practices Are Important

Following best practices helps organizations:

- Improve security
 - Reduce certification errors
 - Complete campaigns on time
 - Improve audit readiness
 - Reduce manual effort
 - Ensure compliance
-

Best Practice 1 – Always Assign Correct Certifiers

The campaign should always be assigned to the correct reviewer.

Examples:

- User Manager Campaign → Manager
- Application Owner Campaign → Application Owner
- Entitlement Owner Campaign → Entitlement Owner
- Role Owner Campaign → Role Owner

Wrong certifiers lead to incorrect certification decisions.

Best Practice 2 – Use Preview Mode Before Production

Always validate:

- Users
- Applications
- Entitlements
- Filters
- Notifications

before launching an Active campaign.

Preview Mode prevents production mistakes.

Best Practice 3 – Configure Reminder Emails

Many reviewers forget certifications.

Reminder emails help improve completion rates.

Example

Campaign

↓

Reminder after 3 days

↓

Reminder after 7 days

↓

Campaign completed on time.

Best Practice 4 – Enable Automatic Revoke Tasks

When access is rejected,

Saviynt should automatically:

Reject

↓

Create Revoke Task

↓

Provisioning

↓

Access Removed

This reduces manual work.

Best Practice 5 – Use Campaign Templates

Instead of creating campaigns repeatedly,
save the configuration as a template.

Benefits

- Faster deployment
 - Consistent configuration
 - Fewer mistakes
-

Best Practice 6 – Review High-Risk Access Frequently

Applications like:

- SAP
- Active Directory
- AWS
- Oracle
- ServiceNow

should be certified more frequently than low-risk applications.

Best Practice 7 – Enable Savi AI & Intelligent Recommendations

Recommendations help reviewers:

- Approve faster
- Reduce manual decisions
- Improve consistency

The final decision always remains with the reviewer.

Best Practice 8 – Keep Audit Reports

Always export:

- Campaign Reports
- Certification Reports
- Campaign Detail Reports

These reports are useful during compliance audits.

Certification Workflow Best Practice

Create Campaign

Preview Campaign

Launch Campaign

Reminder Emails

Review Access

Auto Revoke

Export Reports

Archive Reports

Troubleshooting

Scenario 1 – Certifier Cannot Reject Access

Problem

Reviewer clicks **Reject**.

Comment popup never appears.

Access cannot be rejected.

This issue commonly occurs in **Role Owner Campaigns**.

Cause

Required SAV Role permissions are missing.

Solution

Add the following permissions:

SUBMENU.ATTESTATION.attestations_remaccess

SUBMENU.ADMIN.campaign_remaccess

After assigning these permissions, verify that the **Enter Comments** popup appears and the reviewer can submit the rejection.

Scenario 2 – Access Denied While Opening Attestation Page

Problem

Reviewer logs in.

Clicks Certifications.

Receives

Access Denied

Cause

Missing certification page permission.

Solution

Add

SUBMENU.ATTESTATION.certification_list

to the certifier's SAV Role.

After this,

the reviewer can access the Attestation page.

Scenario 3 – Reviewer Can See All Certifications

Problem

A certifier should only see assigned certifications.

Instead,

they can see every certification.

Cause

Incorrect SAV Role permission.

Solution

Assign

SUBMENU.CAMPAIGN.campaign_allCampCertAccess

appropriately so the role behaves as intended and verify visibility according to organizational requirements.

Scenario 4 – Certifier Becomes Inactive

Problem

Campaign started.

Reviewer leaves the company.

Campaign still assigned.

Nobody can complete it.

Solution

Use

User Update Rules

↓

Transfer Ownership

↓

Replace Certifier

Also configure:

- Default Certifier
- Secondary Manager

to avoid this issue.

Scenario 5 – Reminder Emails Not Sent

Cause

Possible reasons

- SMTP not configured
 - Email template missing
 - Notification disabled
 - Email queue failure
-

Solution

Verify

- SMTP
 - Templates
 - Notification Schedule
 - Mail Queue
-

Scenario 6 – No Certifications Generated

Possible Causes

- Incorrect campaign filters

- Wrong certifier mapping
 - Campaign launched in Preview Mode
 - No users imported
 - Empty scope
-

Solution

Check

- Campaign Filters
 - Identity Repository
 - User Import
 - Campaign Configuration
-

Scenario 7 – Rejected Access Not Removed

Cause

Auto Remediation disabled.

Provisioning Job not executed.

Solution

Verify

- Revoke Task
 - Pending Tasks
 - WSRETRY Job
 - Connector
 - Provisioning Status
-

Scenario 8 – Reports Cannot Be Downloaded

Cause

- Missing permission
 - Campaign not completed
 - Export restriction
-

Solution

Check

- User permissions
 - Campaign status
 - Export settings
-

Scenario 9 – Wrong Reviewer Receives Campaign

Cause

Incorrect:

- Manager Mapping
 - Entitlement Owner
 - Application Owner
 - Role Owner
-

Solution

Verify ownership mappings.

Re-import users if necessary.

Launch a new campaign.

Scenario 10 – Campaign Shows No Users

Cause

Possible reasons

- Incorrect filters
 - Empty application
 - No imported accounts
 - Wrong scope
-

Solution

Check

- Filters
 - Imported Users
 - Imported Accounts
 - Imported Entitlements
-

Real Production Example

Company

ABC Bank

Quarterly User Manager Campaign launched.

Manager John reports:

"I cannot reject access."

Support team investigates.

Finds

Missing permission

SUBMENU.ATTESTATION.attestations_remaccess

Permission added.

Manager logs in again.

Reject popup appears.

Issue resolved.

Another Production Example

Company launches campaign.

Managers receive no certifications.

Investigation shows:

Manager field missing during HR Import.

Solution:

Correct HR mapping.

Run User Import.

Launch campaign again.

Managers receive certifications.

Common Production Mistakes

Mistake	Result
No Preview	Wrong users certified
Wrong Certifier	Incorrect approvals
No Reminder Emails	Pending certifications
Auto Revoke disabled	Rejected access remains
Reports not exported	Audit issues
Wrong Filters	Empty campaign
Missing Manager Mapping	Managers receive nothing

Troubleshooting Workflow

Interview Questions

Q1. Why should Preview Mode always be used?

It validates campaign configuration before affecting production users.

Q2. Why are reminder emails important?

They help reviewers complete certifications before campaign deadlines.

Q3. What causes rejected access to remain after certification?

Usually Auto Remediation/Revoke Task configuration is missing or provisioning jobs such as **WSRETRY** have not completed successfully.

Q4. A reviewer cannot reject access. What will you check?

- SAV Role permissions
 - Reject popup permissions
 - Required submenu access
 - Browser/session if permissions are correct
-

Q5. What causes an Access Denied error on the Attestation page?

Missing certification page permissions in the assigned SAV Role.

Q6. Why would no certifications be generated?

- Incorrect filters
- Wrong certifier mapping
- Empty campaign scope

- Users/accounts not imported
-

Q7. What reports should be exported after campaign completion?

- Campaign Summary
 - Certification Report
 - Campaign Detail Report
-

Q8. How do you troubleshoot a campaign with no reviewers?

Verify:

- Manager Mapping
 - Owner Mapping
 - Filters
 - Campaign Configuration
 - Imported identities
-

Q9. What is the benefit of Campaign Templates?

They reduce setup time, improve consistency, and minimize configuration errors.

Q10. How do you troubleshoot certification issues in production?

Follow a structured approach:

1. Identify the campaign type.
 2. Verify campaign configuration.
 3. Check reviewer mappings.
 4. Validate notifications.
 5. Review provisioning jobs and logs.
 6. Retest after fixing the issue.
-

Lab 8 – Common Troubleshooting Questions

Q1. Manager cannot reject access. What is the solution?

Answer:

Verify the required SAV Role permissions, especially the permissions needed to display the rejection comments popup.

Q2. Certifier receives "Access Denied."

Answer:

Check whether the certifier's SAV Role contains the required certification page access permission.

Q3. Why are no certifications displayed?

Answer:

Check:

- Campaign filters
 - Reviewer mapping
 - Campaign status
 - Imported users/accounts
-

Q4. Reviewer left the company during certification. What should you do?

Answer:

Transfer ownership to another active reviewer using **User Update Rules**, or use a configured **Default Certifier** or **Secondary Manager**.

Quick Revision

- Always use **Preview Mode** before launching production campaigns.
- Configure **Reminder Emails** to improve completion rates.
- Enable **Automatic Revoke Tasks** for rejected access.
- Save recurring campaigns as **Campaign Templates**.
- Export **Campaign Detail Reports** for audits.
- If a certifier cannot reject access, verify required **SAV Role permissions**.
- If the **Attestation Page** shows *Access Denied*, verify certification page permissions.
- If no certifications are generated, check filters, mappings, imported data, and campaign scope.
- If reviewers become inactive, transfer ownership or use fallback certifiers.
- Always troubleshoot methodically by checking configuration, mappings, permissions, jobs, and logs before making changes.
